

# Integration of Kurento with Asterisk

---

## Software Dependencies

The project requires a running and correctly configured implementation of the following:

1. Kurento Media Server 6.6.0
2. Asterix Server (TODO: WRITE VERSION NUMBER HERE)
3. TURN SERVER

## Node Dependencies

The package.json file should contain an updated list of all the packages being used to get this to work. If you add a package please remember the --save argument. To make sure all the required packages are installed run:

```
npm install
```

## Node Configuration

Set the correct values in the config/default.json or the config/development.json or config/production.json depending on which value you set for your NODE\_ENV on your machines environment variables.

## Running the Program

Use the following command to run the thing:

```
npm start
```

If everything goes well you should be able to access this via a WebRTC compatible browser:

```
https://localhost:8443/
```
